WELCOME TO PRESENTATION

Hello I AM KISHAN KUMAR STUDENT OF DIPLOMA CSE , NETAJI SUBHAS INSTITUTE OF TECHNOLOGY . BIHTA.,PATNA

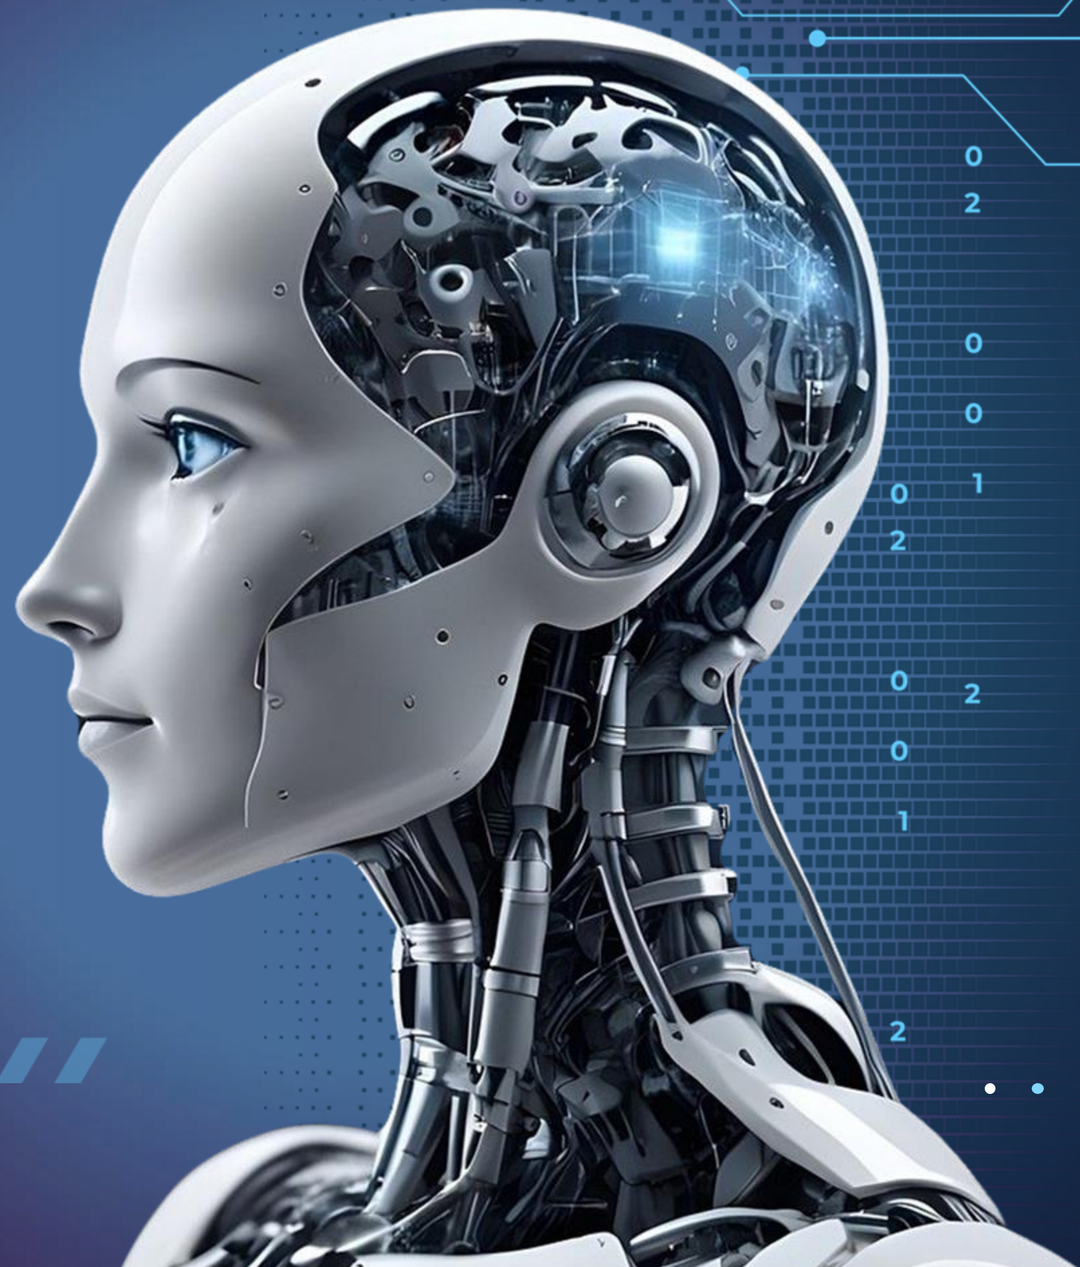

AI & EMERGING TECHNOLOGY

WHAT THE FUTURE OF AI

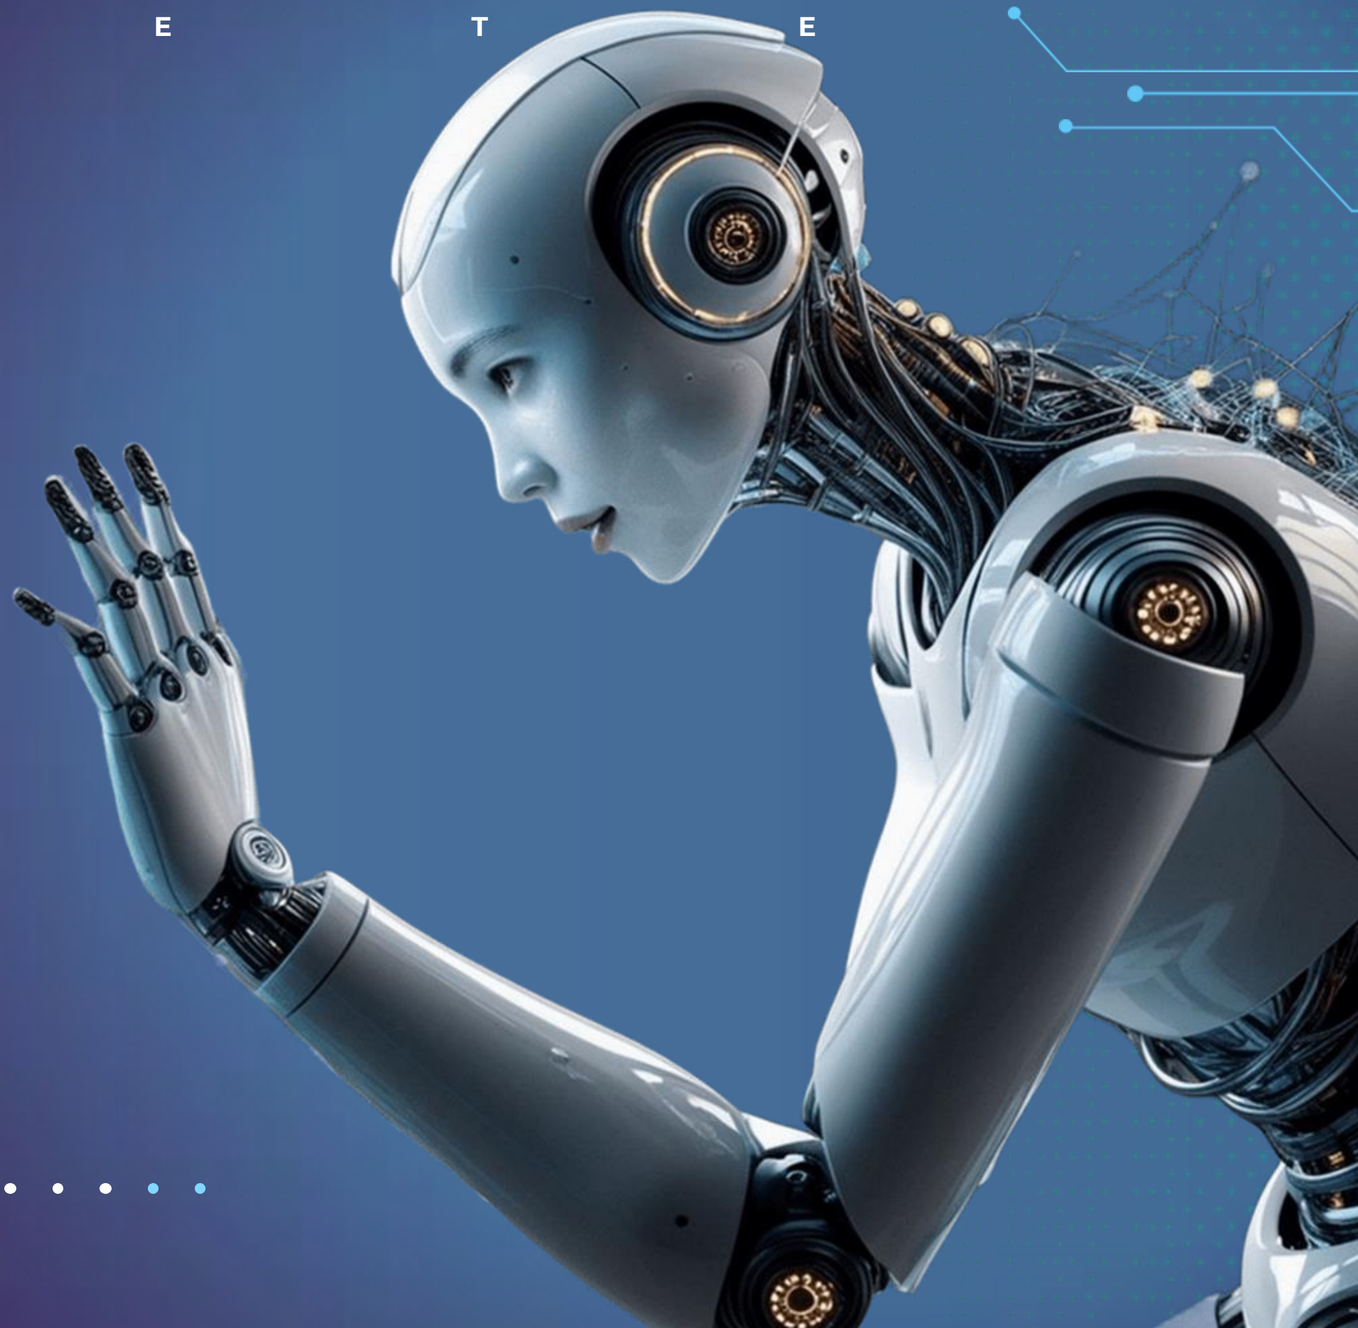

PRESENT BY	CODE HANMA
TEAM LEADER	KISHAN KUMAR
MEMBER	KISHAN KUMAR SUMIT MAHARAJ
MENTOR	ATIF SIR,POOJA MAM

ENGINEERS `DAY

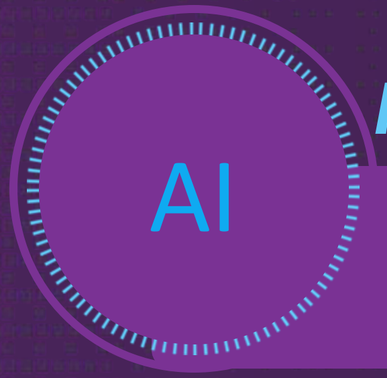

INTRODUCTION

- Artificial intelligence (A.I) is currently one of the hottest buzzwords in tech and with good reason. The last few years have seen several innovations and advancements that have previously been solely in the realm of science fiction slowly transform into reality .
- A.I is use in almost all industries, giving a technological edge to all companies integrating (A.I) at scale.
- A.I lest you focus on the most critical task and make better decision based on acquired data related to a use case. I can be used for complex task , such as predicting maintenance requirements , and finding the best route for a delivery truck.

4 Pillars of Emerging Tech

Artificial Intelligence

Machines learn pattern from past data to make smart decision without manual hard –coding

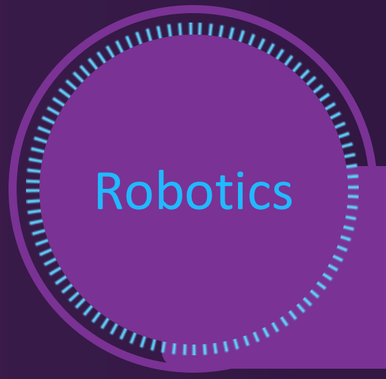

Internet of Things (IOT)

.A network of interconnected physical sensors that collect real time field data.

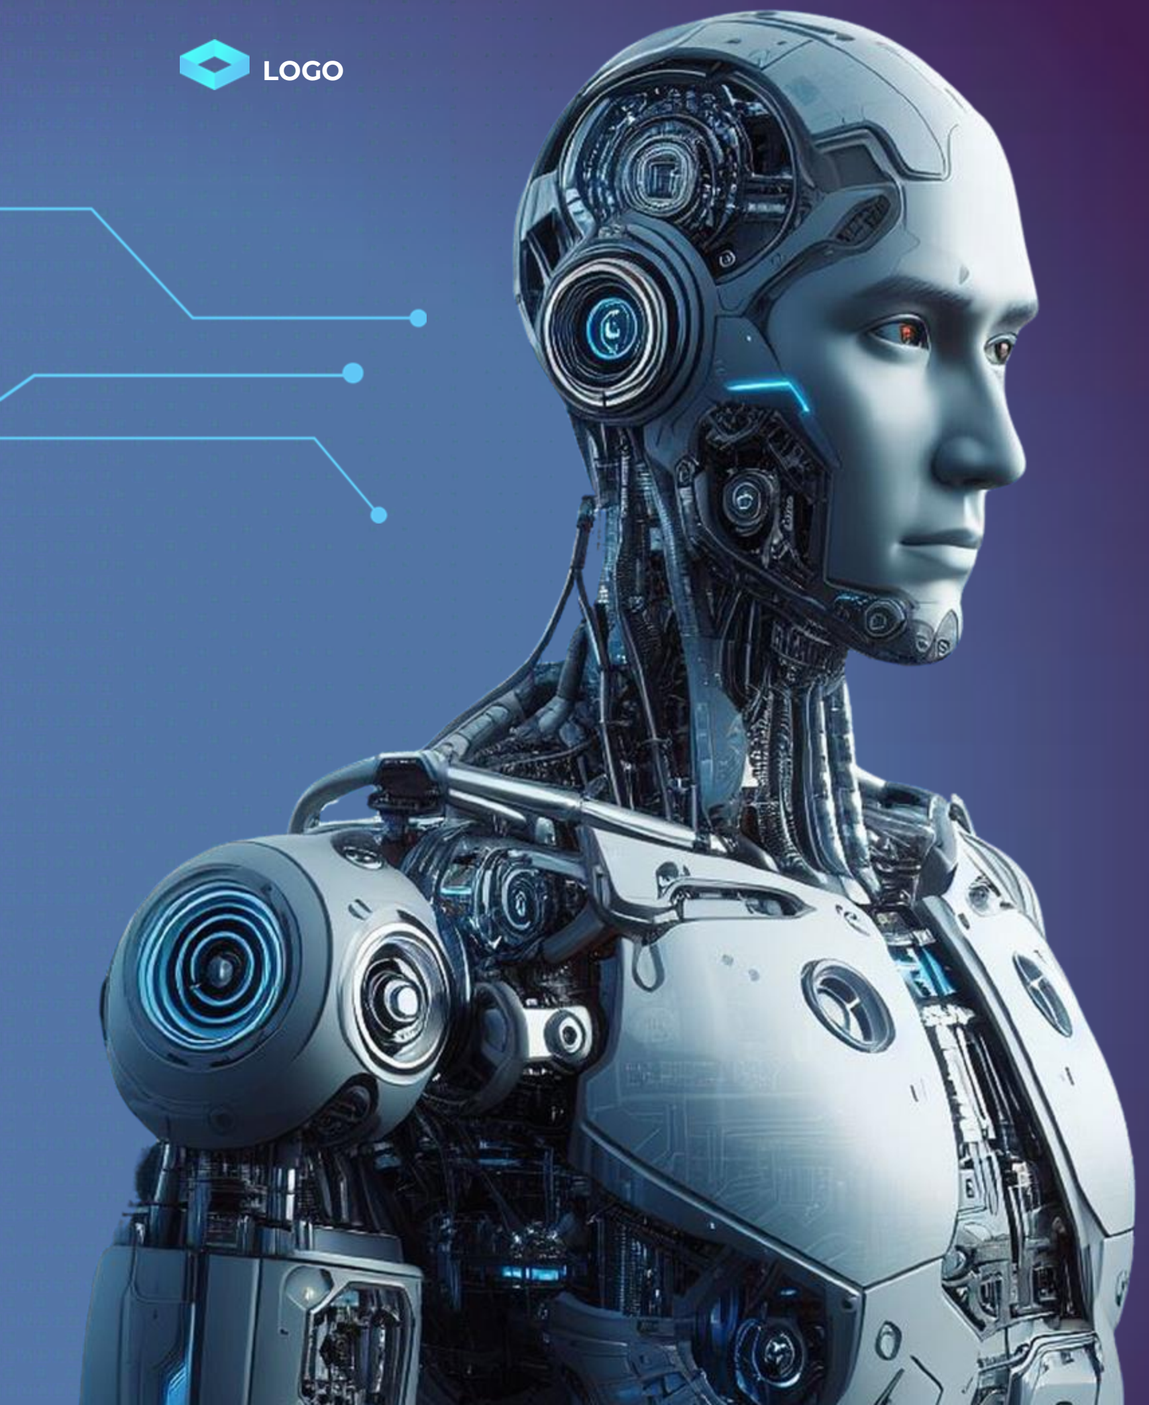

Cloud & Edge computing

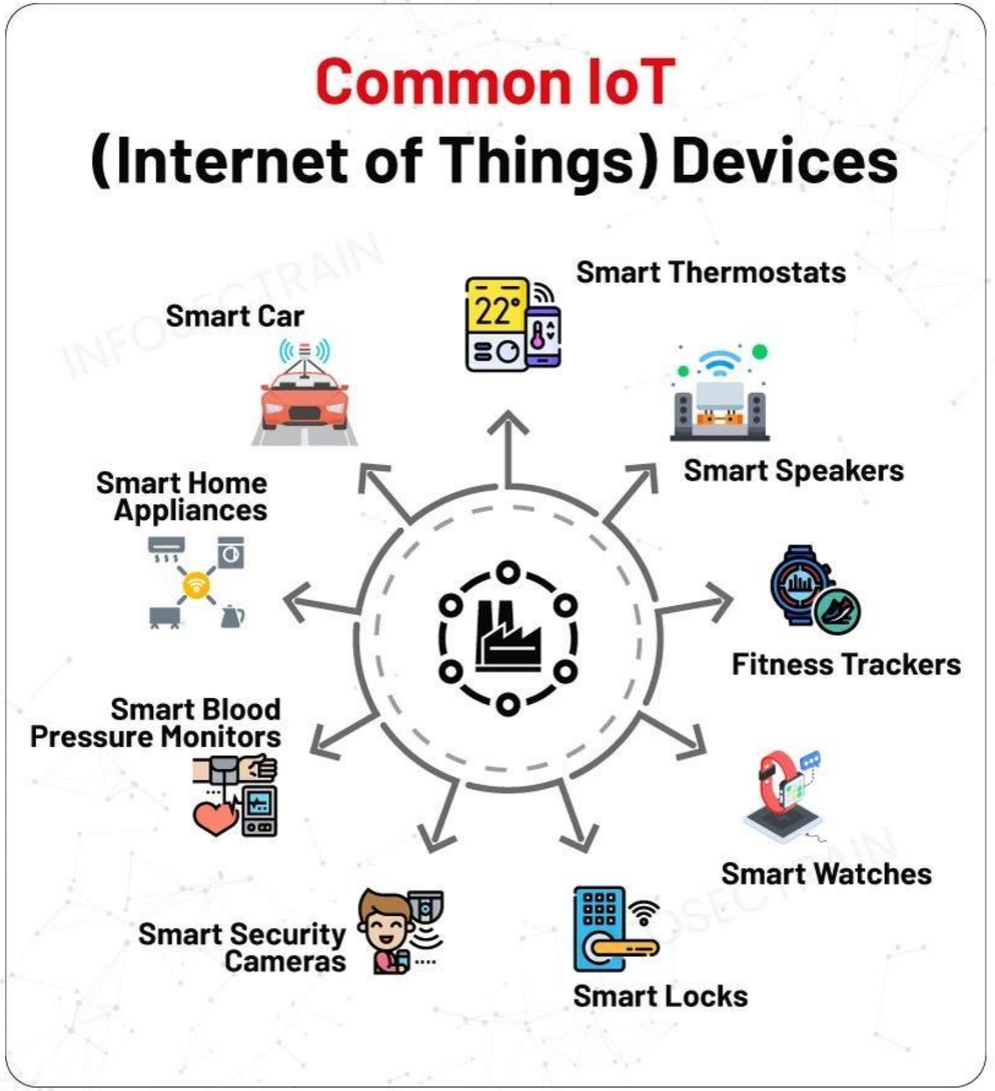

The cloud manages heavy data storage, while edge devices deliver fast local responses.

Robotics & Automation

Hardware and smart software combine to execute dangerous and repetitive task with high precision.

Common IoT
(Internet of Things) Devices
Smart Car
Smart Thermostats
22°
Smart Speakers
Smart Home Appliances
Fitness Trackers
Smart Blood Pressure Monitors
Smart Watches
Smart Security Cameras
Smart Locks

Real-World Application

Software Engineering

Automated code synthesis, smart bug fixing, and rapid test-case execution.

Smart Infrastructure

Dynamic traffic light sequencing and power load balancing managed video live camera sensors

Predictive Maintenance

Receiving early alert before machine breakdown in factories using motor heat and vibration telemetry.

Precision Agriculture

Assessing crop health, soil moisture levels, and targeted fertilizer needs through drone computer vision.

Key Benefits & Impact

High Speed & Efficiency

Complex computational simulation run with in minutes or seconds, substantially accelerating engineering output.

Error Minimization

Human error is completely eliminated across precision engineering calculations and circuit simulations.

Digital India Impact

AI facilitates seamless delivery of digital banking, telemedicine, and educational resources to Tier-2 and Tier-3 cities.

Resource Optimization

Running digital simulations prior to physical manufacturing delivers significant cost saving on raw materials.

CONTACT

Challenges & Limitations

Challenge:1
Data Privacy & Security

Protecting massive datasets from cyber leaker
Unauthorized access, and privacy breaches remains the foremost challenge.

challenge:2
System Reliability

AI tools can occasionally produce erroneous output , making final verification by human engineers mandatory.

Challenges & Limitations

Challenge:3
Technical Skill Gap

Keeping pace with rapidly evolving technologies requires engineers to continuously build hands-on practical skill.

challenge:4
Hardware & Energy Costs

Deploying massive (A.I) modes requires building sustainable green computing systems and high-performance cooling infrastructure.

THE PRESENTATION IS DONE!
THANKS FOR YOUR ATTENTION!
